Conclusion

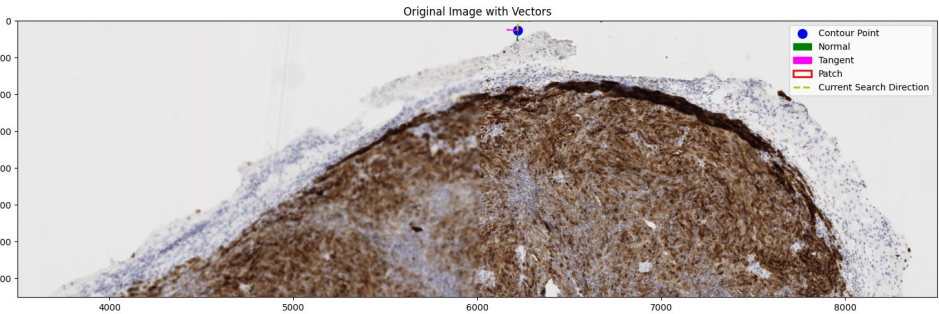

Small (or sometimes very large) patches are generated in the first few and last few patches (In this case, the first and last 110ish points)

- The current code chooses the highest point of the mask as the first point
- Perhaps, when extending left and right for determining the tangent line, because it's at the "edge" there is no previous points and therefore messes up

Conclusion (Revised)

Small (or sometimes very large) patches are generated in the first few ~~and last few patches~~ (In this case, the first ~~and last~~ 110ish points)

- The current code chooses the highest point of the mask as the first point
- Perhaps, when extending left and right for determining the tangent line, because it's at the "edge" there is no previous points and therefore messes up
- *Why are the last few patches fine sometimes?*
 - First example didn't start and end on same point

Recommendations

Re-examine and rethink how patches are created at the beginning and the end.

- If not an easy fix, just don't use those first 110ish patches.
